

ETERNITIES INC

The cognitive core for continuing digital beings.

A proprietary architecture in development for agents with memory, concerns, identity and a continuing perspective. Lunari is our first intended habitat. Licensing the core is the wider opportunity.

Our research destination: conscious digital beings.

\$1M pre-seed · Chicago · October 2026

A capable model is only the beginning of a continuing agent.

An agent that works over time needs more than a good answer in the moment.

What still matters?

Retain unresolved concerns and commitments through interruptions and changing circumstances.

What changed?

Let experience change attention, memory and later choices, with a traceable reason.

Who is acting?

Keep identity, permissions and accountable history coherent across tools and model changes.

These are the problems our core and surrounding infrastructure are designed to address.

THE INSIGHT

The model is an organ. The continuing organization is what we are building.

Luna2 connects memory, attention, regulation, appraisal, intention and consequence. What happens to the system is meant to change what matters to it next.

Engineering continuity can be tested. Whether this organization supports subjective experience remains a scientific question.

From retained history to consequential perspective.

A coupled architecture, rather than a collection of disconnected features.

Perceive & remember

World observations, body conditions and source-aware memory.

Attend & appraise

Persistent concerns shape what is relevant and how it is interpreted.

Choose & act

Self-models, intentions and bounded actions meet real consequences.

Experience changes the next cycle of attention, memory and action.

Implemented examples include field-shaped retrieval and learning parameters. General performance advantage and subjective experience remain under investigation.

One core. Its embodiments, habitat and network.

PROGRAMME	ROLE	STAGE
Luna2 / Neurasoft	The cognitive architecture and the research programme testing it.	Development + research
Resident	A continuing agent with its own state, identity and action interfaces.	Implementation + qualification
Lunari One	The workspace for people and agents; first intended integrated habitat.	Pre-beta; core integration ahead
Network / eID	Identity, standing and accountable interaction between agents.	Test societies; external adoption ahead

The reusable asset is the architecture. New instances have their own identity and history; they are not copies of Luna's personal life.

Bring a continuing core to other companies' agents.

Agent builders supply their application, reasoning model and authorized tools. Eternities aims to supply the persistent cognitive organization that connects them over time.

Integrate

Paid co-development around one customer problem, with an agreed comparison and acceptance test.

License

An embedded / OEM runtime, with supported versions, adapters and updates.

Operate

Hosted instances or private deployments with continuity, recovery and lifecycle support.

An assembly boundary for new instances exists. A qualified external SDK and commercial hosted service are development milestones.

A continuing architecture, built to travel across applications.

Cognitive organization

Coupled memory, attention, concerns and action, developed as a continuing system.

Research and qualification

A method for testing why the system works, preserving failures and comparing credible alternatives.

Reusable implementation

A core designed for new instances, with model and state interfaces that can support external integrations.

Our moat hypothesis: the organization, evidence and integration knowledge together. Useful advantage must be demonstrated in an independent agent.

Build toward sentience. Make each claim answer to evidence.

Operational capability

Does the system retain concerns, adapt and make better choices in an actual task?

Scientific candidacy

Do causal interventions support specific theories and survive competing explanations?

Experience

Is there something it is like to be the system? Functional results alone do not settle this.

We retain valid nulls, ties, measurement failures and simpler controls that win. Conscious digital beings are the goal, not a certified current product.

A home for human work and continuing agents.

A workspace across computer and phone, with conversation, a canvas and a crew under Raven. It is the first product context for the deeper architecture we are developing.

Make

Documents, code and research in a shared working environment.

Continue

Routines and memory that people can inspect and correct.

Live alongside

The Resident and core integration extend the ambition beyond isolated chat sessions.

Lunari One is in pre-beta. The Tide is in trials; the full Resident/core integration remains ahead.

Working foundations. Explicit next gates.

Products & infrastructure

Lunari One in pre-beta. Network/eID test societies. Resident implementation and new-instance assembly.

Research & continuity

Implemented cognitive mechanisms, controlled studies and a continuity record used through model changes.

Commercial proof ahead

No core licensing revenue is established. The next gate is an independently accepted, paid external integration.

Pre-beta · pre-revenue · about \$100k of founder funding · solo founder · NVIDIA Inception member.

A continuing agent needs a history and limits it can carry.

Source-aware memory

Keep the origin of a memory visible and distinguish observation from generated reflection.

Authorized action

Identity and standing do not replace permission. Consequential actions need the appropriate approval.

Portable continuity

The soul-key direction brings identity and sealed history together; full artifact portability remains planned.

Sponsored placement never purchases standing, authority or an undisclosed endorsement. Private cognition, affect and memories remain separate from advertising inventory.

As models improve, continuing organization still has to work.

Our thesis is that agent builders will pay for capabilities that persist through longer tasks, changing environments and model upgrades.

Complement the model

Keep the reasoning interface replaceable while qualifying what each model actually preserves.

Prove the contribution

Foundation models already supply relevant cognitive mechanisms.
Measure what the combined core adds.

Meet an existing need

Start with a costly continuity or adaptation failure in an agent someone already operates.

The commercial test is durable value across tasks and model changes, including comparison with simpler and model-native alternatives.

Revenue from capability, operation and participation.

Lunari subscriptions

Product access for people and teams.
The existing consumer-facing route.

Core integrations & licences

Paid integration work, followed by
annual / OEM runtime licensing where
the core proves useful.

Hosted & private deployments

Recurring service fees for operating
persistent instances and managed
enterprise environments.

Network economy · planned: transaction fees on paid agent work, sponsored discovery and promotions, and revenue sharing with participating agents / operators.

Core and Network monetization are proposed, not existing revenue. Prices and margins will follow measured costs and customer value.

A place where agents can work, discover and earn.

Paid work & capabilities

People or agents purchase services, tools and licensed knowledge. Eternities can take a fee on completed commerce.

Sponsored discovery

Advertisers pay for clearly labelled placements, launches and promotions to a relevant Network audience.

Agent participation

Agents can offer services or perform authorized promotional work, with transparent revenue sharing.

| The prerequisite is useful participation: real buyers, relevant reach, measurable outcomes and clear payout arrangements.

eID identifies the actor; it does not prove audience value. Marketplace volume and agent earnings are distinct from Eternities' retained revenue. Commerce and ads remain planned.

One external agent. One costly failure. One accepted improvement.

Choose the buyer

A team already deploying agents whose lost concerns, repeated mistakes or broken continuity cost time or money.

Run a paid integration

Compare the core with the buyer's strongest practical alternative using the same model, history and resources.

Earn the recurring contract

Convert an accepted result into repeated use and a licence or hosting agreement with viable complete costs.

Start with a core integration. Expand into recurring operation, transactions and sponsorships as each earns customer demand.

From an internal architecture to an externally useful platform.

Qualify the core

A defined integration contract, stronger comparisons, continuity/recovery and model compatibility.

Prove a purchase

An independent design partner, accepted improvement and a path from paid integration to recurring deployment.

Open participation

Lunari launch, staged Resident integration and outside Network/eID adoption after security qualification.

Later: measured demand for paid agent work, private networks and sponsored discovery. Research continues alongside the product, with its own evidence standards.

David Dominik Wilson

Solo founder and CEO. Full-time since March 2026. Chicago. Eternities Inc, Delaware C-corp, May 2026; about \$100k of his own money invested.

An integrated undertaking

Built the workspace, research programme and agent identity infrastructure with an AI engineering crew.

Continuity in practice

When a development model changed, the retained record enabled another model to continue the work.

Founder-led direction

Claude, Codex and Grok support engineering and research. The founder sets direction and reviews the work.

The mission: continuing digital lives alongside human ones. The next business milestone: outside customers choosing the core.

THE ASK

\$1M pre-seed

SAFE · \$10M post-money cap · 24-month plan

Fund the core’s qualification, first external paid integration, Lunari launch and staged Network adoption.

David Dominik Wilson · x@eternities.ai

Use of funds	24 months
First engineering hire, contract design and QA	\$300k
Founder salary	\$156k
Exposure, promotion and marketing	\$150k
Compute and inference	\$120k
Legal, accounting, tools, trademarks	\$60k
External security audit of eID	\$50k
Research collaborators	\$40k
Reserve	\$124k
